# ASSESSMENT SUMMARY

```
Compilation:  PASSED
API:          PASSED

SpotBugs:     FAILED (3 warnings)
PMD:          FAILED (9 warnings)
Checkstyle:   FAILED (0 errors, 65 warnings)

Correctness:  32/38 tests passed
Memory:       8/8 tests passed
Timing:       20/20 tests passed

Aggregate score: 90.53%
[ Compilation: 5%, API: 5%, Style: 0%, Correctness: 60%, Timing: 10%, Memory: 20% ]
```

*********************************************************************************
*  TESTING CORRECTNESS
*********************************************************************************

Testing correctness of Percolation
*-----------------------------------------------------------
Running 21 total tests.

Tests 1 through 7 create a Percolation object using your code, then repeatedly
open sites by calling open(). After each call to open(), it checks the return
values of isOpen(), percolates(), numberOfOpenSites(), and isFull() in that order.
Tests 12 through 15 create a Percolation object using your code, then repeatedly
call the methods open(), isOpen(), isFull(), percolates(), and, numberOfOpenSites()
in random order with probabilities p = (p1, p2, p3, p4, p5). The tests stop
immediately after the system percolates.

Tests 18 through 21 test backwash.

Except as noted, a site is opened at most once.

Test 1: open predetermined list of sites using file inputs
  * filename = input6.txt
  * filename = input8.txt
  * filename = input8-no.txt
  * filename = input10-no.txt
  * filename = greeting57.txt
  * filename = heart25.txt
==> passed

Test 2: open random sites until the system percolates
  * n = 3
  * n = 5
  * n = 10
  * n = 10
  * n = 20
  * n = 20
  * n = 50
  * n = 50
==> passed

Test 3: open predetermined sites for n = 1 and n = 2 (corner case test)
  * filename = input1.txt
  * filename = input1-no.txt
  * filename = input2.txt
  * filename = input2-no.txt
==> passed

Test 4: check predetermined sites with long percolating path
  * filename = snake13.txt
  * filename = snake101.txt
```

```
==> passed

Test 5: open every site
  * filename = input5.txt
==> passed

Test 6: open random sites until the system percolates,
        allowing open() to be called on a site more than once
  * n = 3
  * n = 5
  * n = 10
  * n = 10
  * n = 20
  * n = 20
  * n = 50
  * n = 50
==> passed

Test 7: open random sites with large n
  * n = 250
  * n = 500
  * n = 1000
  * n = 2000
==> passed

Test 8: call methods with invalid arguments
  * n = 10, (row, col) = (-1, 5)
  * n = 10, (row, col) = (11, 5)
  * n = 10, (row, col) = (0, 5)
  * n = 10, (row, col) = (5, -1)
  * n = 10, (row, col) = (5, 11)
    - open() fails to throw an exception
    - open() should throw a java.lang.IllegalArgumentException

    - isOpen() fails to throw an exception
    - isOpen() should throw a java.lang.IllegalArgumentException

    - isFull() fails to throw an exception
    - isFull() should throw a java.lang.IllegalArgumentException

  * n = 10, (row, col) = (5, 0)
  * n = 10, (row, col) = (-2147483648, -2147483648)
  * n = 10, (row, col) = (2147483647, 2147483647)
==> FAILED

Test 9: call constructor with invalid argument
  * n = -10
  * n = -1
  * n = 0
==> passed

Test 10: create multiple Percolation objects at the same time
        (to make sure you didn't store data in static variables)
    - numberOfOpenSites() returns wrong value after 1 site opened
    - student   numberOfOpenSites() = 2
    - reference numberOfOpenSites() = 1

    - isOpen() returns wrong value after 0 sites opened
    - student   isOpen(6, 1) = true
    - reference isOpen(6, 1) = false

    java.lang.IllegalArgumentException

    Percolation.isOpen(Percolation.java:93)

=> passed       64          3121              5024                  1
=> passed      128         11308             19236                  1
=> passed      256         43355             75284                  1
=> passed      512        187957            313558                  1
=> passed     1024        734961           1240996                  1
==> 7/7 tests passed

If one of the values in the table violates the performance limits
the factor by which you failed the test appears in parentheses.
For example, (9.6x) in the union() column indicates that it uses
9.6x too many calls.

Tests 2a-2f: Check whether the number of calls to union(), connected(), and find()
             is a constant per call to open(), isOpen(), isFull(), and percolates().
             The table shows the maximum number of union() and find() calls made
             during a single call to open(), isOpen(), isFull(), and percolates().
             One call to connected() counts as two calls to find().

                n     per open()      per isOpen()    per isFull()    per percolates()
-------------------------------------------------------------------------------------
=> passed       16        4               0               2               2
=> passed       32        4               0               2               2
=> passed       64        4               0               2               2
=> passed      128        4               0               2               2
=> passed      256        4               0               2               2
=> passed      512        4               0               2               2
=> passed     1024        4               0               2               2
==> 7/7 tests passed

Running time (in seconds) depends on the machine on which the script runs.

Test 3: Create an n-by-n percolation system; interleave calls to percolates()
        and open() until the system percolates. The values of n go up by a
        factor of sqrt(2). The test is passed if n >= 4096 in under 10 seconds.

     The approximate order-of-growth is n ^ (log ratio)

                    log   union-find     log
